gametocytogenesis onset-specific protein - malaria parasite (Plasmodium falciparum)

C;Species: Plasmodium falciparum C;Date: 17-Apr-1993 #sequence_revision 17-Apr-1993 #text_change 09-Jun-2000

C. Accession: \$27829
R. Alano, P.; Premawansa, S.; Bruce, M.; Carter, R.
submitted to the EMBL. Data Library, April 1991
A. Description: A stage specific gene expressed at the onset of gametocytogenesis in P
A. Reference number: \$27829
A. Accession: \$27829
A. Molecule type: mRNA
A. Residues: 1-217 ALA>
A. Residues: 1-217 ALA>
A. Residues: GB: X84904; EMBL: M38286; NID: g1340125; PID: e139902; PID: g1340126

DNA (cytosine-5-)-methyltransferase (EC 2.1.1.37) T6G15.160 - Arabidopsis thaliana N.Alternate names: protein T6G15.160
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Date: 23-Apr.1999 #sequence_revision 23-Apr.1999 #text_change 05-May-2000
C; Accession: T06663
R; Bevan, M.: Murphy, G.; Ridley, P.; Hudson, S.; Bancroft, I.; Mewes, H.W.; Mayer, K.F.X submitted to the Protein Sequence Database, April 1999
A; Reference number: 215791
A; Residues: 1-1404 <BEV>
A; Residues: 1-1404 <BEV>
A; Residues: 1-1404 <BEV>
A; Residues: Left: Columbia; BAC clone T6G15
A; Cosertimental source: cultivar Columbia; BAC clone T6G15

```
The present sequence is the antigenic epitope P591, derived from gamete specific antigen, Pfg27 of the sexual stage of Plasmodium falcjarum. It is used in the construction of recombinant protein comprises, melittin signal peptide, (His)6 tag, Trecll epitope from tetranus toxoid and 21 antigenic epitopes from Trecll epitopes from Trecll epitopes from tetranus toxoid and 21 antigenic epitopes from Trecll epitope from tetranus toxoid and 21 antigenic epitopes from Trecll epitope from tetranus toxoid and 21 antigenic epitopes from Trecll epitopes epitopes were obtained at different stages of the life cycle of P. falciparum. CDC/NITMALVAC-1 vaccine has antiparasitic actions. Anti-CDC/NITMALVAC-1 vaccine has antiparasitic infections. Anti-CDC/NITMALVAC-1 and prevention of malarial infections antiparasitic antiparamin in biological samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recombinant protein; CDC/NIIMALVAC-1; multivalent; malaria; vaccine; T-cell epitope; tetanus toxoid; antigenic epitope; treatment; SSP-2; circumsporozoite protein; CSP; sporozoite surface protein:2; SSP-2; apical membrane antigen:1; LSA-1; merozoite surface protein:1; MSP-1; MSP-2; apical membrane antigen:1; AMA-1; erythrocyte binding antigen:175; EBA-175; rhoptry associated protein-1; RAP-1; gamete specific antigen; pf927; antiparasitic; prevention; anti-CDC/NIIMALVAC-1 antibody;
  Novel recombinant protein as vaccine for treating malarial infection comprises antigenic peptides obtained from different stages of plasmodium falciparum life cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23.350

The present sequence is that of recombinant protein CDC/NIIMALVAC-1, which is a multivalent, multistage malarial vaccine. The recombinant protein comprises, melitin signal peptide, (His)6 tag. T-cell epitope from tetanus toxoid and 21 antigenic epitopes from circumsporozoite protein (CBS), sporozoite surface protein-2 (SSP-2), liver stage antigen-1 (LSA-1), merozoite surface protein (MSP-1), MSP-2, apical membrane antigen-1 (AMA-1), erythrocyte binding antigen-175 (EBA-175), rhoptry associated protein-1 (AAA-1), and gamete specific antigen, Pfg27. These epitopes were obtained at different stages of the life cycle of plasmodium faltiparaum. CDC/NIIMALVAC-1 vaccine has antiparasitic activity and can used for treatment and prevention of malarial infections. Anti-CDC/NIIMALVAC-1 antibodies can be used for detecting

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA
                                                                  AAR96217 is a continuous epitope derived from Plasmodium falciparum in the sexual stage of development. The epitope was identified using monoclonal antibodies (MADS) 686, 1662, 19F1 and 11612 (ATCC HBILIS5, HBILIS6, HBILIS7, And HBILIS4, respectively). The epitope is shared by 3 reduced male and female gamete surface antigens of mol. wt. 260, 59, and 53 kD, from which the above hybridomas can be produced. The epitope is conserved among parasites from diverse geographical locations and may be expressed in bacteria. The epitope is useful in subunit vaccines to block the transmission of malaria.
                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used in vaccination The nucleic acids (I) may be used to produce to vaccinate suppertides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH5391 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 to the present invention of the present invention.

N. B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification,
                 AAH55098 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4465 to 4464.
                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S. epidermidis open reading frame protein sequence SEQ ID NO:1110.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4464.

CAFI protein has been shown to bind to another transcription factor CCR4 and regulate the expression of glucose-repressible allohol dehydrogenase (ADH2) gene. The present sequence is useful for producing transgenic plants with altered levels of FOP2/CAFI transcription factor to control expression of various genes or transgenes. The CAFI protein may also be used to design or identify inhibitors of cell metabolism that may be
                                                                                               Soybean, POP2 transcription factor; CAF1 transcription factor; ADH2 gene; glucose-repressible alcohol dehydrogenase gene; cell metabolism; transgenic plant; herbicide; expressed sequence tag; EST.
                                         Soybean POP2/CAF1 transcription factor encoded by expressed sequence tag.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a CAF1 (also known as POP2) transcription factor from srl.pk0126.b4 clone isolated from soybean root cDNA library srl. CAF1 protein has been shown to bind to another transcription factor CCR4 and regulate the expression of glucose-repressible alcohol dehydrogenase (ADH2) gene. The present sequence is useful for producing transgenic plants with altered levels of POP2/CAF1 transcription factor to control expression of various genes or transgenes. The CAF1 protein may also be used to design or identify inhibitors of cell metabolism that may be useful as herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

The lipase variants were created in an attempt to find important substitution sites that affect the stereoselectivity of the lipase enzyme. Important substitutions found for Pseudomonas species were Phe221Leu, Val266Leu and Leu12871Le. Lipase variants of reverse stereoselectivity are used to produce optically active 1,4-dihydropyridine which is an important intermediate compound in
species cepacia and glumae and from Chromobacterium viscosum (AAW09625 only). The lipase variants were created in an attempt to find important substitution sites that affect the stereoselectivity of the lipase enzyme. Important substitutions found for Pseudomonas species were Phe221Leu, Val266Leu and Leu2871le. Lipase variants of reverse stereoselectivity are used to produce optically active
                                                                                                                                                                                                                                                                                                                                                                                                                                    pseudomonas glumae lipase modified to have reverse stereoselectivity.
                                                                                                                                                                                                             Gaps

is present at position 129 of mature P. glumae
lipase"
                                                                                                                                                                                                                                                                                                                          Mutant; lipase; enzymatic detergent; substitution; variant; improved; hydrophobicity.
sequences are based upon the wild-type P. glumae sequence disclosed in EP407225-A (UNILEYER PLC). The lipase variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules; the lipase variants show improved in-the-wash lipolytic activity and may
                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                         sequences are based upon the wild-type P. glumae sequence disclosed in EP407255-A (UNILEYER PLC). The lipase variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. the lipase variants show improved in the wash lipolytic activity and may be used in enzymatic detergent compsns.
                                                                                                                Pseudomonas lipase variant with increased surface hydrophobicity has improved in-the-wash performance, useful in enzymatic detergent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "possible site for Thr to Leu substitution"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               residue
                                                                                                                                                                                                                                                                                                                                                                                                                                      AAR88009-R88018 are protein variants of Pseudomonas glumae lipase. The sequences are based upon the wild-type P. glumae sequence disclosed in EP407225-A (UNILEVER PLC). The lipase variants may contain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules, the lipase variants show improved in the wash lipolytic activity and may be used in enzymatic detergent compsns.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mutant; lipase; enzymatic detergent; substitution; variant; improved; hydrophobicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

AARR8009-R88018 are protein variants of Pseudomonas glumae lipase. The sequences are based upon the wild-type P. glumae sequence disclosed in Ep407225-A (UNILEVER PLC). The lipses variants may contrain one or more of the amino acid substitutions indicated in the features table. Using these variants it was shown that lipases can be modified in a such a way that interaction with the substrate can be improved without forming large hydrophobic areas on the modified lipase surface which allow aggregation of lipase molecules. The lipase variants show improved in the wash lipolytic activity and may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pseudomonas lipase variant with increased surface hydrophobicity has improved in-the-wash performance, useful in enzymatic detergent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 1, Application US/0812025

Patent No. 5502168
GENERAL INPORMATION:
GENERAL INPORMATION:
TITLE OF INVENTION: NOVEL CONTINUOUS AND CROSS-REACTING
TITLE OF INVENTION: EPITOPE FOR HUMAN MALARIA VACCINE
NUMBER OF SEQUENCES: 2
CORRESPONDENCE ADDRESS:
ADDRESSE: CUSHMAN, DARBY & CUSHMAN
STREET: 1615 L. Street, N.W.
CITY: Washington
STATE: D.C.
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB 1; Length 20; 0.00048;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CUMPRY: USA

ZIP: 20036

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/120,225
FILING DATE:
CLASSIFICATION: OF PROBLEM OF PR

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequence 3, A Sequence 3, A Sequence 2, A Sequence 2, A Sequence 6, A Sequence 6, A Sequence 5, A Sequence 5, A Sequence 5, A Sequence 5, A Sequence 20, Sequence 20, Sequence 20, Sequence 20, Sequence 20,

Sequence 3, Application US/08819288
Sequence 3, Application US/08819288
Patent No. 595562
GENERAL INFORMATION:
APPLICANT: Ecker, Joseph
APPLICANT: Alonso, Jose
TITLE OF INVENTION: PLANT GENES FOR SENSITIVITY TO ETHYLENE
TITLE OF INVENTION: AND PATHOGENS
OCRESPONDENCES: ADDRESS:
ADDRESSES: Woodcock Washburn Kurtz Mackiewicz & No. 5955652ris
STREET: One Liberty Place - 46th Floor
                          COMPUTER KEALMELE FURM:
MEDIUM TYPE: Floppy disk
COMPOURE: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
SURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/449,015
FILING DATE: 24-MAY-1995
CLASSIFICATION: 435
PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 07/727,235
FILING DATE: 03-JUL-1991
ATTORNEY/AGENT INFORMATION:
NAME: Kokulis, Paul N
REGISFRATION NUMBER: 16,773
REFERENCE/DOCKET NUMBER: PRK/5970/91731
TELECHMONICATION INFORMATION:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       COUPTER: USA

Sequence 10. Application US/08449015

Datent No. 5804409

GENERAL INFORMATION:
APPLICANT: BOS, Jannetje W.
APPLICANT: VERRIPS, Leon G.
APPLICANT: VISSER, Cornells T.
APPLICANT: VISSER, Christiaan
TITLE OF INVENTION: PRODUCTION OF ACTIVE PSEUDOMONAS GLUMAE
TITLE OF INVENTION: LIPASE IN HOMOLOGOUS OR HETEROLOGOUS HOSTS
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
                                                                       APPLICANT: BOS, Jannetje W.
APPLICANT: FERKEN, Leon G.
APPLICANT: VERRIES, Cornelis T.
APPLICANT: VISSER, Christiaan
TITLE OF INVENTION: PRODUCTION OF ACTIVE PSEUDOMONAS GLUMAE

--- CATALYTIC ACTIVITY: SEDOHEPTULOSE 7 PHOSPHATE + D-GLYCERALDEHYDE
--- S-PHOSPHATE - D-ERYTHROSE 4 PHOSPHATE + D-FRUCTOSE 6-PHOSPHATE.
--- PATHWAY: NONOXYDATIVE PART OF THE PENTOSE-PHOSPHATE PATHWAY.
--- SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).
--- SIMILARITY: BELONGS TO THE TRANSALDOLASE FAMILY.

THE ALPHA SUBUNIT IS COMPOSED OF AN HEAVY AND A LIGHT CHAIN LINKED BY A DISULFIDE BOND. ALPHA-6 ASSOCIATES WITH EITHER BETA-1 OR BETA-4.
-1- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-1- DEVELOPMENTAL STAGE: ALPHA-6 LEVELS DECREASE WITH AGE.
-1- THM: PHOSPHORYLATED IN VIVO.
-1- SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
-1- SIMILARITY: CONTAINS 7 FG-GAP REPEATS.

                                                                                                                                                                                                                                                                                                             NATURE 392.358(1998).

-I FUNCTION: THE REACTION CATALYZED BY TOPOISOMERASES LEADS TO THE CONVERSION OF ONE TOPOLOGICAL ISOMER OF DNA TO ANOTHER.

-I CATALYTIC ACTIVITY: ATP-INDEPENDENT BREAKAGE OF SINGLE-STRANDED DNA, FOLLOWED BY PASSAGE AND REJOINING.

-I SUBUNIT: MONOMER (BY SIMILARITY).

-I SUBUNIT: MONOMER (BY SIMILARITY).

-I SUBUNIT: WHEN A TOPOISOMERASE TRANSIENTLY BREAKS A DNA WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS WHICH A TYROSYL OXYGEN IN THE ENZYME IS JOINED TO A DNA PHOSPHORUS AT ONE END OF THE ENZYME-SEVERED DNA STRAND.

-I SIMILARITY: BELONGS TO PROKARYOTIC TYPE I/III TOPOISOMERASE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Res. Commun. 177:963-972(1991).

- FUNCTION: ARYLPHORIN IS A LARVAL STORAGE PROTEIN (LSP) WHICH MAY SERVE AS A STORAGE PROTEIN USED PRIMARILY AS A SOURCE OF AROMATIC AMINO ACIDS FOR PROTEIN SYNTHESIS DURING METAMORPHOSIS. IT IS A CONSTITUENT OF THE SCLEROTIZING SYSTEM OF THE CUTICLE, AND SERVES AS A CARRERE FOR ECDYSTEROID HORMONE.
                                                                                                                                                                                                                                                                                                                                                                                                                  ARYLPHORIN SUBBURT C223 PRECURSOR.

-! FUNCTION: BRINDS TO SINGLE-STRANDED SEQUENCES PARTICIPATING IN DNA

REPLICATION IN ADDITION TO THOSE MEDIATING TRANSCRIPTIONAL

REPRESSION (URS1) AND ACTIVATION (CAR1). STIMULATES THE ACTIVITY

OF A COGNARTE STRAND EXCHANGE PROPEIN (SEP1). IT COOPERATES WITH

T-AG AND DNA TOPOISOMERASE I TO UNWIND TEMPLATE DNA CONTAINING THE

SIMIAN VIRUS 40 ORIGIN OF DNA REPLICATION.

-! SUBUNIT: HETEROPITATE ROF 69, 36, AND 13 KDA CHAINS. THE

DNA-BINDING ACTIVITY MAY RESIDE EXCLUSIVELY ON THE 69 KDA SUBUNIT.

The anchor segment is pref. derived from a streptococcal M protein (see AAR41780). Sequence AAR41783 is a peptide sequence from the cs protein of p. falciparum (Nature 314:111-114) suitable for development of a vaccine against malaria.

The sequence NANP can be repeated 3-40 times. When conjugated to a tuberculin protein derivative, the product is useful as an anti-malaria vaccine and provides a high antibody response.

Synthetic peptide antigen analogues of native peptide antigens which are either (1) retro modified, (2) inverso modified or (3) retronances modified with respect to the native antigen can be used to raise antibodies which recognise the native antigen and hence can be used in the treatment and/or prophylaxis of diseases and therapy of disease states. They can be used in the production of vaccines and in assays for antibodies specific for the native antigen. They can have increased stability to degredation after administration and they can be administered orally. This sequence is based on the financodominant epitope of the circumsporozoite coat protein of plasmodium falciparum. The retro-inverso version of this sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                 Peptide; retro; inverso; retro-inverso; therapy; disease; vaccine; immunogen; antibody; antibodies; assay; treatment; prophylaxis; plasmodium falciparum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New retro, inverso and retro-inverso peptide analogues - used as immunogens for the prodn. of antibodies and in diagnosis, therapy and prophylaxis of diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

The malaria circumsporozoite protein repeat region is used in an immunogenic composition along with the T-cell epitope derived from malaria. The T-cell epitope elicits an anti-malarial T-cell response in mammals of diverse genetic backgrounds. The composition can be used as a vaccine to confer prophylactic or therapeutic immunity against malaria. They may also be used to inhibit the propagation of a malarial organism in a susceptible animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a peptide comprising a malarial B-cell epitope, which is contained in the COOH-terminal repeat region of the Plasmodium falciparum circumsporozoite (CS) protein. It is this epitope that stimulates the production of antibodies that specifically recognise and bind to the malarial CS protein. This epitope can be incorporated into a polyoxime with T-cell epitopes to produce a vaccine that is packgrounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunogenic composition containing T cell epitope of malaria-derived peptide - incorporated into a poly:oxime and optionally B cell epitope, used in vaccines to protect against malaria in subjects of differing genetic background(s)
                                           New immunogenic compositions for malaria – comprise malaria derived peptide comprising universal T-cell epitope which elicits

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          T-cell; malaria; immunogenic; anti-malarial; prophylactic immunity.
                                                                                                                                                                                                                                                                                                                                                                         The protein represents 12 amino acid units of the P. falciparum circumsporozoite protein repeat region (AAR70034), which are sufficient for the production of antibodies reactive against the whole protein. Insertion of the coding sequence into the major coat protein gene VIII of bacteriophage Fd in a region of the protein known to be exposed on the virus surface results in expression of the P. falciparum antigen on the phage surface. Thus, the phage is useful in a vaccine composition against malarla, or as a therapeutic/diagnostic product.
                                                                                                                                                                                                                                                                                     Filamentous bacteriophage engineered to display T- and B-cell epitopes and/or a peptide eliciting HIV neutralising antibodies - useful in vaccines and as a therapeutic/diagnostic prod.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a hybrid protein (H1) comprising at least a portion of a particle forming protein and one or more polypeptides having at least one epitope of interest such as an epitopic site of a pathogen or toxin. Also describes is a method for inducing an immune response to one or more epitopes of interest comprising immunising a host with a particle comprising at least in part H1 where the epitopic site is immunologically reactive. The particles can be used as vaccines or for the production of antibodies which can be used for passive immunisation, in vitro diagnostics, extology, histology or other applications. The particles can also be used in assays for detecting the presence of antibodies to the antigen of interest. The present sequence represents a peptide used in the exemplification of the present invention.
                                                                                                                                                                                                                                                             Immunogenic composition; viral particle; hybrid protein; expression; immunogen; diagnosis; passive immunisation; vaccination; vaccine; immune response; epitopic site; pathogen; toxin.

```
The present invention describes a conjugate (A) comprising a catrategically modified hepatitis B core (HBC) protein (I) attached to a trategically modified hepatitis B core (HBC) protein (I) attached to a hapten, where (I) includes amino acids (aas 10-140 of the wild type (II) in the 183 as sequence (given in ANZ29674) and additionally has an insert (II) in the region corresponding to aa's 50-100, where the insert is corresponding to a protective antibody response against corresponding from which the hapten is derived, in humans or other carrians in native HBC protein, increasing the reactivity of aa side chains in native HBC protein, increasing the reactivity Modified HBC can be derivatised in the form of particles by well-defined chemical can be derivatised in the form of particles by well-defined chemical can be derivatised in the form of particles by well-defined chemical corresponding to the cause immunological side-effects.
